The Peculiar Energy Machine of Jasper James

Moray B King

There is a little known energy device, rumored to have been used by the government, which manifested a spectacular 20 kilowatt output from a pair of “thermionic” cylindrical tubes. The stainless steel tubes were 22 inches long and only four inches in diameter. The inventor, Jasper L. James, died shortly after filing his patent in 1981, but the patent, *Thermionic-Thermoelectric Generator System and Apparatus*, US 4,368,416 was still issued in 1983. What is peculiar is that the explanation in the patent completely violates thermodynamics on a number of points, yet the patent was granted because the device actually worked – perhaps too well.

What did make sense in the patent was the switching circuit, which offered a clue to the correct explanation for the device. The output from each hot tube was switched to charge an associated external capacitor via a large pulse. The thermionic tube operates at the “pulsed abnormal glow discharge” region, discovered by Paulo and Alexandra Correa (US patent 5,449,989), to manifest a negative resistance characteristic and excess energy production.

This is the first time a public presentation for the James device has ever been given, and the explanation offers a surprising room temp variant!

H2G Blackbox: Lightning Storm Under the Hood !!!

Walt Jenkins

After twenty years of research into alternate fuel systems, H2 Global made a breakthrough in the conversion of energy stored in, fresh or sea water, and in the application of that process to internal combustion engines, replacing fossil fuels, such as gasoline, diesel, bunker fuels, etc. The process runs these engines on a clean water based fuel, which in it’s current iteration offers twice the power curve, of 97 octane gasoline and a reduction of toxic emissions, up to 97%. IT DOES NOT USE ELECTROLYSIS. The process uses 97% water and 3% gasoline. 100% water fuel is now being tested.

The presentation for this year’s conference will include new videos with endoscopic cameras inside the black box while it is running. New test results for emissions and dynamometer tests on scooters running both 93 octane gasoline and side by side comparison with H2 Global Water Fuel. A new engine test stand will feature a video of an engine and an H2G water fuel system running in side by side tests with 93 octane gasoline fuel demonstrating performance in direct comparisons. New video’s of the dune buggy will also show close up details on the H2G water fuel systems implemented on a vehicle, which is powered by solar, wind and H2G water fuel.

Neutral Spike! Unleashing EMP Effects

Norm Wootan

Working daily with electrical and electronics equipment, I encountered strange phenomenon for which conventional electrical knowledge could not answer. Creating an EMP event on my workbench made me consult NASA’s and various universities’ research on CME, magnetic ropes, anti-parallel magnetic flux annihilation-reconnect phenomenon. A study of nuclear, and non-nuclear gave a very clear view of “How to” create the effect.

My local research is named “Neutral Spike” and was derived from the ferro resonance phenomenon frequently encountered in electrical power distribution and Tesla’s *Colorado Springs Notes* (pg 25). Tesla’s 1899 work in telegraphy at his Houston Street lab laid the groundwork for the working principle of the future Wardenclyffe Tower for worldwide power distribution. The exercise at Colorado Springs was to verify his vision and methodology of earth transmitted energy.

The study of EMP is interesting for it opens a whole new “CAN of Worms” on particles resulting from the conversion of magnetic flux into kinetic energy and heating at point of annihilation, then an ultra-powerful magnetic flux burst at re-connection. (EMP shot). Since we can create the effect in our lab, there has to be a method to define, capture and harness the phenomenal energy that manifests!
